Homework 9: Server Setup

Due Friday, 4/3 @11:40am

This week's homework is to finish the server side setup, and write a report (with screenshot) to demonstrate that you have done the work and how you did it. In your report, you need to cover the followings:

- Modify `/system/etc/hosts`, so you can use `www.example.com` and another name of your choice. These names should all point to your xampp server (i.e. your laptop in most cases).
- Configure your Apache virtual hosts, so `www.example.com` and the name that you select can point to different folders (i.e., different server-side programs).
- Modify `index.php` to implement the following URI (`Hostname` refers to `www.example.com` or the name that you choose)
    - `Hostname/movies/:` upon receiving this URI, your program should return "Hello Movies".
    - `Hostname/movies/id/alice:` upon receiving this URI, your program should return "Hello alice", where "alice" can be replaced by any other name.
